Submitted (APR-1991) to the EMBL/GenBank/DDBJ databases.
-:- SIMILARITY: BELONGS TO THE MYCOBACTERIAL PPE FAMILY.
-:- CAUTION: In strain Oshkosh the gene for this protein is incerrupted in position 307 by an IS6110 element.
-:- CAUTION was originally (Ref.3) thought to be a dihydrofolate

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                             A Geneseq 19Jun03;*

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       600
                                                                                                                                                                                                                                                                           The sequence represents Mycobacterium fusion protein antigen TbF14 consisting of a His tag for purification, antigen MtB81 and antigen Mo2. Compositions comprising at least 2 heterologous antigens, as a fusion protein, and vectors expressing the fusion proteins are used as vaccines to prophylactically immunise mammals (especially humans) against infection by Mycobacteria. The compositions contain at least 2 heterologous antigens that increase the serological sensitivity of individuals infected with tuberculosis, a disease frequently affecting patients with acquired immunodeficiency disease, AIDS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     9

Novel Mycobacterium tuberculosis polypeptide comprising an immunogenic portion of M. tuberculosis antigens Mtb-81 and Mtb-67.2, useful for diagnosis, treatment and monitoring therapy of tuberculosis Polypeptides comprising an immunogenic portion of Mycobacterium tuberculosis antigens Mtb-81 or Mtb-67.2 or variants that differ by substitutions, additions, insertions and/or deletions but which still react with antigen specific antisera or T-cells are described. Also described are polynucleotides encoding the polypeptides. The polypeptides, expression vectors expressing the polypeptides or comprising an antisense polynucleotide, or an antigen presenting cell comprising a sequence encoding the polypeptides are useful for determining the presence or absence of M.tuberculosis in whole blood, serum, sputum, plasma, saliva, cerebrospinal fluid or urine in a patient infected with human immunodeficiency virus (HIV).
                                                                                                                                                                                                                                     DB 21; Length 2502;

The present invention relates to a method for early detection of active mycobacterial disease or infection comprises assaying a biological fluid sample for the presence of early antibodies specific for an 88-kDa Mycobacterium tuberculosis (Mt) protein or immune complexes consisting of an 88-kDa M. tuberculosis protein antigen complexed with an antibody specific for the antigen. The method is useful for the early and rapid distection of mycobacterial disease, particularly tuberculosis, in individuals at heightened risk of developing tuberculosis. This individuals include human immunodeficiency virus (HIV)-infected subjects or other immunocompromised individuals. This method is a rapid and inexpensive screening procedure for detecting mycobacterial disease. The present sequence is a Mt 88 kDa secreted protein early antigen, used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               128

AAR77501 is encoded by an approx. 3 kb BfrI-PvuI fragment contg. the aceB gene from Cornyeform glutemicum (see AA705501). Nucleorides 1 to 574 can be isolated and used to regulate the expression of a protein-encoding structural gene placed downstream of it, after incorporation into a vector and transfer into a Cornyeform bacterium. Induction of protein expression occurs even when the culture medium contains carbon sources other than acetate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    LSSGSFGDATGFTVQDGQLVVALPDKSTGLANPGQFAGYTGAAESPTSVLLINHGLHIEI

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AQIDXWHRRRVIEPIDMDAYRQFLTEIGYLLPEPDDFTITTSGVDAEITTTAGPQLVVPV 128

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             metabolism and oxidative phosphorylation (SMP) proteins given in AAB7943 to AAB 7963 which are involved in carbon metabolism and oxidative phosphorylation (SMP) proteins given in AAB7943 to AAB 79633 which are involved in carbon metabolism and energy production. The C. glutamicum SMP gene can be used in vectors (II) for expression in host cells and production or modulation of production of fine chemicals, such as, an organic acid, a proteinogenic or nonproteinogenic amino acid (preferred), a purine or pyrimidine base, a mucleoside, a uncleotide, a seturated or unsaturated fatty acid, a diol, a carbohydrate, an aromatic compound, a vitamin, a coffactor, a polyketide, or an enzyme. The presence of (I) or SMP proteins (II) encoded by them are used for diagnosing the presence or activity of corpuspactorium diphtheriae in a subject. (I), (II), (III) or host cells containing them are used to map genomes of corganisms related to c. glutamicum, identify and localise C. glutamicum sequences of interest, in evolutionary studies, in determining SMP protein regions required for the clon, in modulating SMP protein regions required metabolism of sugars, and in modulating high-energy molecule production in a cell (i.e. ATP, NADPH).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               119
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            196
